

* BUG 1 - STATUS FILTER

Bug: Status filter was returning the wrong tasks

File: TaskRepository - Java

I tested the API with

/api / tasks ?status=DONE

but it was also returning tasks with OPEN status.

I found that the SQL query was using AND and OR without proper brackets, so the filters were not working correctly.

I added brackets around the title and description conditions and updated the SQL reference files.

After the fix, selecting DONE only returns DONE tasks and archived tasks are not included.

* BUG 2 - SEARCH DELAY.

Bug: Search API was taking extra time to respond.

File: TaskController.java

While testing the search, I noticed that some requests were unnecessarily slow. I found a `.Thread.sleep()` in the controller which was adding an artificial delay to the requests.

I removed it because it was not needed and was making the API slower

After removing it, search requests return normally without the extra delay.
