

### BUG 3 - INVALID PAGINATION

BUG: Invalid page numbers were causing a server error.

File: TaskController.java

I tested: /api/tasks?page=0 & pageSize=10  
and the API returned a 500 error.

The controller was not checking whether the page number was valid before using it for pagination.

I added validation so that page must be at least 1 and page size must be positive.

Now invalid pagination values return 400 Bad Req, instead of causing a server error.

### BUG 4 - INVALID STATUS.

BUG: Invalid status value were causing a server error.

File: TaskController.java

I tested: /api/tasks?status=INVALID  
and it returned a 500 error.

The issue was that TaskStatus.valueOf() throws an exception when the given status does not exist.

I handled this case and now return 400 Bad Request with an error message.

Valid values like OPEN, IN-PROGRESS, DONE continue to work normally.
